

Unique Features of the “Teich Raised Bed Gardening System”

- The entire garden structure is protected from underneath. This creates a protective seal which prevents small animals (e.g. rabbits, groundhogs, woodchucks) from burrowing up through the bottom of the garden.
- The garden walls are approximately 7’4” tall to keep out deer and other larger animals. The garden is enclosed with vinyl covered welded metal fence.
- The garden structure requires no cementing of posts or other permanent attachments to the ground. It is completely free standing.
- The garden is constructed using wood joinery techniques that offer an all wood environment inside the garden with no exposed metal to rust or corrode.
- There is a self watering feature which can utilize electronic timers. There is also a hose faucet.
- The watering feature includes a custom made pipe manifold with faucets to control zones in the garden. This feature allows each garden bed to be watered independently if necessary.
- The top cap of the garden is designed to allow plants to grow up through the open top but still be protected from the elements with the use of a bird net or sunshade if needed.
- The structure is bolted together which allows it to be disassembled. It is possible to relocate the garden if necessary. The garden can be placed almost anywhere on a property and on almost any terrain.
- The garden beds are specially designed so that they can be reached easily with minimal bending. Walkways are also spaced to provide just enough space to tend the garden.

Raised Beds

Raised beds provide excellent drainage and the ability for sunlight to heat the soil and plant roots, leading to healthier plants, longer planting seasons and larger harvests.

Walkways

Wide walkways permit gardeners easy access to every square inch of the planting surface. We use over two tons of river rock to provide a stable and surefooted path for gardeners of all ages and levels of physical ability.

Embedded Watering System

We attach a custom made manifold to each Teich Garden System that delivers water to a solid brass faucet at the end of each garden bed. Then, we attach soaker hoses to the internal faucets to direct water to the individual planting beds. A free standing hose faucet is available in the garden in addition to the embedded watering system.

Animal Resistant Design

Each Teich Garden System is surrounded by vinyl-coated heavy gauge galvanized metal fencing. Vertical support beams rise over 7 feet high and horizontal beams across the top of the structure discourage deer from jumping in. Other aspects of our design prevent burrowing animals from entering the garden system from below.

Imported Soil

We use approximately 5000 lbs of organic soil and amenders in our gardens. This assures our customers effortless gardening in a clean, healthy growing medium.

Top Structure

The top of the structure allows for netting to protect from birds or climbing critters or a sunshade depending on what your garden conditions require.

Door

The door is designed to be wide enough to allow easy access into the garden while holding bulky and large items. We equip the door with a safety release pull so that no one can get locked inside accidentally.

Frame

All wood construction uses joinery techniques that leaves no exposed metal to rust anywhere in the gardening area. This makes the garden very user friendly and safe for the whole family.

Fence

Each garden is enclosed with a vinyl-coated heavy gauge galvanized metal fence. Heavy gauge fencing is sturdy enough to allow plants to trellis and vine on it.
